

Stanislav Kiselevskii

Senior Software Developer (C#, .NET)

017675494593 • st.kiselevskii@gmail.com

linkedin.com/in/st-kiselevskii • [GitHub Portfolio](#)

Mannheim, Germany (Open to relocation within Germany)

Residence and Work Permit in Germany

Senior Software Engineer with 20+ years of experience in C#/.NET, delivering production systems across fintech, telecom, and RnD. Skilled in microservices architecture, REST API design, and legacy modernization within Agile teams at international organizations, including EPAM and Heidelberg University. Brings additional expertise in hardware-software integration and IoT across complex technical and scientific domains.

SKILLS

- Backend:** C#, .NET 10, .NET Framework, ASP.NET, Python, Microservices, REST API, pub/sub architectures, Entity Framework Core, Dapper, Windows Services, System.Security.Cryptography, Redis, RabbitMQ, gRPC, SOLID, Clean Architecture
- Desktop & UI:** Blazor, Windows Forms, WPF, MFC
- Data:** Microsoft SQL Server, PostgreSQL, MongoDB, T-SQL (DDL, DML, SP, UDF, Triggers, Indexes), ASN.1, Binary data processing
- Cloud & DevOps:** Docker, GitHub Actions, CI/CD, Bash Scripting, Linux, Blue/Green Deployment, AWS, Azure
- Testing & Quality:** Unit Testing, xUnit, MSTest, TDD, Load Testing, Performance Profiling (WinDBG, SQL Server Profiler)
- AI & Productivity:** LLM Integration, TAG (Tool-Augmented Generation), AI-Assisted Development

LANGUAGES

English - C1 (advanced) | German - A2 (in progress) | Russian - C2 (native)

EXPERIENCE

Astronomisches Rechen-Institut (Heidelberg University), Heidelberg

05/2024 – 05/2026

Research institute developing scientific software and simulation systems for spacecraft modeling

Fixed-term contract

Senior Software Engineer

- Architected a real-time simulation platform in C#/.NET 10 with a modular architecture, REST API backend, and Blazor web interface that enabled reproducible computational experiments for the future [Gaia NIR spacecraft project](#) prototyping.
- Built a configurable hardware simulation layer in C# that modeled 66 independent sensor units with timing delays and error injection, used for automated validation of control algorithms.
- Developed a closed-loop data processing pipeline that chained four independent modules through pub/sub messaging, enabling end-to-end integration testing.
- Reimplemented Kalman Filter computational algorithm from a Python prototype in .NET 10, reducing processing time from 18 seconds to 600 milliseconds, a 30x performance improvement.
- Translated complex domain requirements from research stakeholders into technical specifications and production-ready C# components, bridging the gap between prototype logic and maintainable software.

Epam

05/2022 – 11/2023

Global IT services and software engineering company. HQ in the USA

Senior Backend Developer

- Extended order execution reporting on a stock trading desktop platform to capture partial-fill events, which gave traders granular visibility into multi-stage order execution across their portfolios and corrected misreported trade completion data in downstream reports.
- Optimized memory allocation and query performance in the analytics data preparation pipeline on a 4.5M+ LOC codebase, eliminating 30-second timeouts on client-side model loading.
- Migrated legacy Visual Basic modules to C# and consolidated .NET Framework versions across project components, which removed outdated external library dependencies and restored consistent build targets across the 20-year codebase.

SoftMediaLab

03/2017 – 04/2022

Custom software development firm

Senior Software Developer

- Architected end-to-end an [automated trading platform](#) for fiat markets, covering requirements engineering, system design, multi-algorithm implementation, and production deployment across multiple release cycles.
- Designed a fault-tolerant exchange connector that transparently restored trading context after disconnection periods, replaying missed events with staleness flags to prevent outdated trading decisions.
- Engineered configuration optimizer that emulated trade sessions on historical data to find optimal algorithm parameters, paired with a runtime controller that adjusted live trading configurations to match current market conditions.

- Built an exchange emulator backed by a historical session database, which enabled retrospective algorithm testing and controlled experimentation without live market risk.
- Led Copy Trading product delivery for Binance crypto exchange end-to-end, from requirements gathering and RnD through MVP deployment to production handoff with code review mentorship for the inheriting developer.
- Implemented data-exchange integrations between company systems and a bank portal, adding CSV and XLSX import into PostgreSQL, report generation via Google Sheets API, and automated file retrieval from Google Drive.

Eastwind

04/2011 – 03/2017

Telecom billing software provider

Senior Software Developer / Team Lead

- Built a reliability analysis system that made service availability measurable across a distributed service cluster, supported compliance with the 0.99995 availability requirement through CI/CD-integrated checks, and established real-time production monitoring as a permanent operational practice.
- Led a team of up to four developers to build a production-grade load testing environment from scratch with 14 traffic types and configurable load profiles based on live operator statistics, and introduced release gating that blocked deployments when the availability factor regressed.
- Created ASN.1 notation parser and C# code generator that produced ready-to-compile format drivers from telecom data specifications, with driver creation time reduced from weeks of manual work to under one hour.
- Developed a hot-swappable plugin system for the inter-operator data mediation router that loaded new format converters at runtime without service restart, which eliminated planned downtime and enabled independent deployment of custom converters.

Freelance

06/2007 – 03/2011

Software Engineer / Electrical Systems Engineer

- Developed desktop automation tools in C++ and MFC and built a C#/.NET WinForms desktop application for an SMS notification service with direct USB communication to GSM hardware for automated subscriber alerts.

Prosoft Systems

10/2003 – 06/2007

Industrial automation and SCADA systems for electric power

Software Engineer

- Architected an electrical grid topology model with historical tracking of equipment replacements and grid switching events in MS SQL Server, which enabled automated recalculation of energy billing data across 26,000 metering points and aggregated values.
- Implemented automated bypass switch accounting based on real-time dispatching data, a capability previously unavailable in any competing product, which eliminated manual spreadsheet reconciliation by client operations staff.

Ural State Technical University

04/1999 – 10/2003

Major technical institution of higher education

Software Engineer

- Built a real-time CDR analysis system for the campus telephone switch in C++ that automatically identified faulty relay blocks by monitoring connection signals, which reduced equipment downtime from five hours of manual inspection to 90 minutes.

EDUCATION

Ural State Technical University, Russia

1998

Engineer's degree in Automated control of electric power systems

5-year program, equivalent to a combined Bachelor's and Master's degree
